NEISS-AI FACT SHEET 1 · OCTOBER 2026

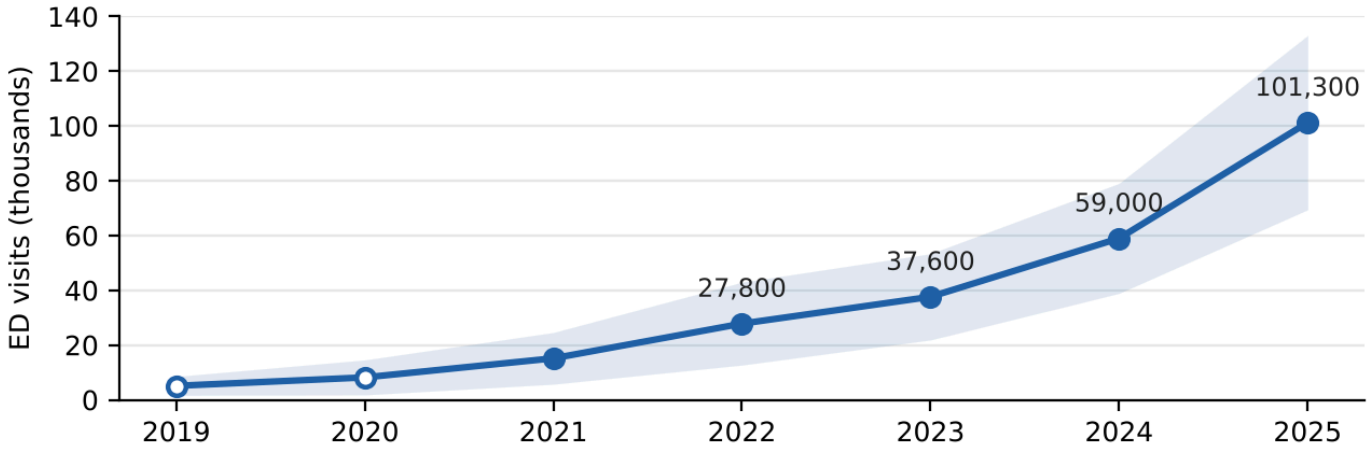

E-bike injuries in the United States, 2019–2025

National estimates of emergency department (ED) visits, from the US Consumer Product Safety Commission's National Electronic Injury Surveillance System (NEISS)

101,300
estimated ED visits for e-bike injuries in 2025 (95% CI 69,500–133,000)

+72%
increase from 2024 (59,000 visits)

3.6×
the 2022 level (27,800 visits)

Estimated US ED visits for e-bike injuries, with 95% confidence bands. Hollow points (2019–2020) are estimates CPSC would consider potentially unstable.

Who is injured and how (2024–2025 combined)

- **Mostly men:** about 79% of injured riders were male (95% CI 76–82%).
- **Head and face:** about 31% of injuries were to the head or face (95% CI 28–34%).
- **Broken bones:** fractures were the most common diagnosis, about 29% of visits (95% CI 26–31%).
- **Hospital stays:** about 1 in 6 visits (17%; 95% CI 12–23%) ended in admission, transfer or an observation stay; for bicycle injuries the share was 14% (95% CI 10–17%).
- **Older riders:** visits among adults 65 and older rose from about 3,200 in 2022 to 9,600 in 2025.

Is the rise just a change in coding? No. CPSC gave e-bikes their own product code in 2024, and both 2024 and 2025 use that code, so the 2024–2025 rise is not a coding effect. For 2019–2023, when e-bikes shared a code with mopeds, NEISS-AI reads the injury narratives so every year is counted the same way.

About these estimates

- NEISS is a national probability sample of about 100 US hospital EDs. Estimates use the survey weights and design, with 95% confidence intervals.
- NEISS-AI identifies e-bikes from product codes and the written injury narratives. National e-bike totals for 2022–2024 are within 4% of CPSC's published figures.
- **Limits:** these are counts of ED visits, not injury rates; the number of riders is not known. Only ED-treated injuries are included, and estimates are national, not state-level.
